

The Patient Experience

Perspectives on Today's Healthcare

Background

The American Academy of Physician Associates (AAPA) advocates for the physician associate/assistant (PA) profession and provides tools to improve the PA practice and patient care. Earlier this year, AAPA approached The Harris Poll to revisit work that had been conducted in 2014. Unlike the past survey, AAPA wanted to take a wider look at the state of the U.S. healthcare system and capture the issues patients are encountering within today's system. Additionally, the research seeks to understand attitudes toward PAs to reinforce the need for this group of expertly trained, high-quality, compassionate providers. This summary includes research findings from the national sample collected as well as the oversample of adults living in Louisiana.

The research revealed that the U.S. healthcare system is stretched thin – a reality that was both illuminated during and exacerbated by the COVID-19 pandemic. In addition to healthcare provider burnout and staffing shortages, many feel that not everyone has equal access to care, and simply navigating the system can be overwhelming and time-consuming. This may contribute to the general lack of confidence that the U.S. healthcare system will be able to support the care they need in the future. Beyond the need to reduce the cost of healthcare, adults agree that having stronger relationships with providers – especially those whom they trust – has the potential to improve their health. This is where PAs, working to the full extent of their education and ability, have an opportunity to elevate healthcare within the U.S.

Views of the System

A third of adults in Louisiana give the U.S. system a failing grade, and a substantial proportion of Louisiana residents are concerned about healthcare workforce shortages affecting themselves or their families.

- Dissatisfaction with healthcare system:** Thirty-three percent of Louisianans grade the healthcare system as poor (with 26% giving it a D and another 7% giving it an F). Nationally, 26% rate it the same: (D/F: 18% and 8% respectively).
- Concerns over workforce shortages:** Louisianans worry about healthcare workforce shortages affecting their families (67%) or themselves (69%), in line with 68% nationally fearing the same for their loved ones or themselves.

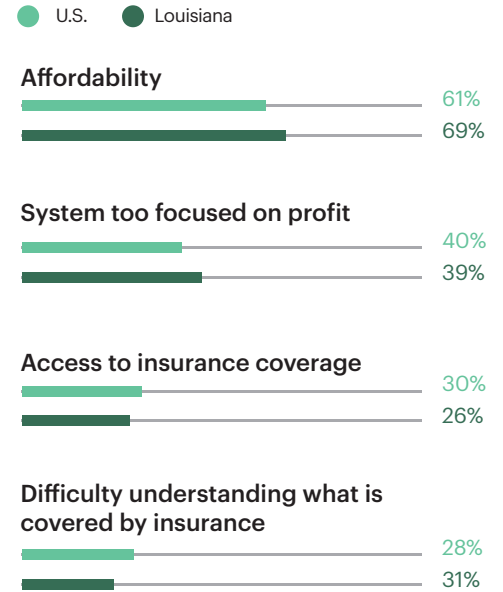

Healthcare Grades: U.S. Healthcare System

Louisianans are significantly more likely than adults nationally to identify affordability as the top deterrent to healthcare access. Louisiana residents express serious concerns over the financial strain of healthcare and admit often being unable to afford care for themselves or their family.

- Affordability, profit and insurance coverage deterring care:** Affordability stands as a primary hurdle, with nearly 7 in 10 Louisiana adults (69%), significantly higher than adults nationally (61%) saying that affordability in general is among the top barriers to accessing healthcare.
- Concerns over financial strain:** One in 5 adults (21%) in Louisiana say healthcare costs strain their and/or their family's finances, compared to 26% of adults nationally. Additionally, nearly half of adults in Louisiana (47%) (directionally higher than adults nationally; 43%), say there are often times they cannot afford healthcare for themselves or their families.

Biggest Barriers to Accessing Healthcare

Ways in Which the Healthcare System Is Not Meeting People's Needs

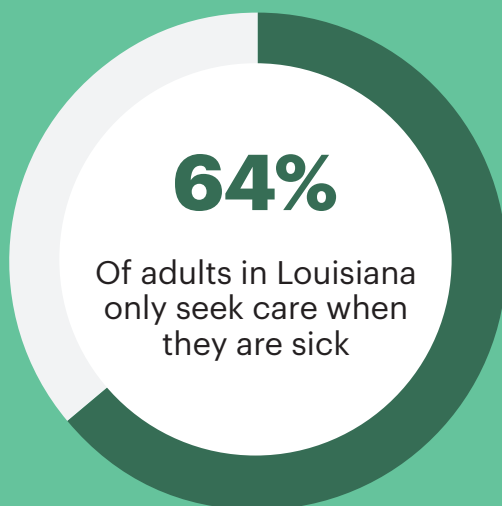

Coordinating care burdens patients and informal caregivers assisting family and friends navigating the healthcare system.

- **Coordinating care:** Over six in 10 adults in Louisiana (60%) and nationally (65%) say that coordinating and managing healthcare is overwhelming and time-consuming. Adults in Louisiana report spending an average of 2.3 hours coordinating care for themselves or their families, and an average of 3.0 hours if they are helping someone else navigate care. Nationally, adults spend an average of 2.0 hours coordinating care for themselves or their families and an average of 3.3 hours helping someone else.
- **Long wait times:** On average, whether national or in Louisiana, it takes around a month to get a needed appointment with a healthcare provider. For those who do not get an appointment within a week, it takes an average of 3.9 weeks nationally and 4.0 weeks in Louisiana.

Cost worries, access barriers, care coordination challenges, and resulting frustration continue to influence behavior of Louisianans, which has mental health impacts for residents.

- **Skipping care:** Nearly half of Louisianans (46%) say they have delayed or skipped care, in line with what is seen nationally (44%). And, Louisianans are directionally more likely than adults nationally to only seek care when they are sick (64% vs. 61%, respectively).
- **Cost of care and taking time off:** Financial cost is the top reason adults delayed or skipped care in Louisiana and nationally (48% and 40%, respectively), followed by not being able to take time away due to other responsibilities (35% vs. 30% nationally).
- **Impact of skipping care:** Moreover, over half of adults in Louisiana (54%) who delayed or skipped care within the past two years experienced some kind of impact as a result, including a worsening condition (26%) negative impact on mental health (21%), and/or lost faith in the healthcare system (20%). Results were in line with adults nationally, with 60% reporting some kind of impact.

46% OF ADULTS IN LOUISIANA

Have either skipped or delayed healthcare services within the past two years

Two in five Louisianans observe that their healthcare provider(s) appear burned out or overburdened which may lead to patients feeling rushed during appointments. Louisianans want providers to take more time to understand them and they place value on shared backgrounds and recognition of their culture and ethnicity from providers.

- Rushed care due to demands of healthcare providers:** Nearly three quarters of adults in Louisiana (72%), directionally higher than what we see nationally (66%), agree that healthcare providers seem more rushed than they have been in the past.
- Provider burnout:** Over 2 in 5 adults in Louisiana (41%) and nationally (47%) worry their healthcare providers appear to be burned out/overburdened and 7 in 10 (70%) in Louisiana and nationally (71%) worry that the demands on providers are too great.
- Patient sentiment – rushed and misunderstood:** A third of adults in Louisiana (34%) and nationally (30%) acknowledge that they personally have felt rushed during a healthcare appointment and wish that providers took more time to understand them (64% in Louisiana and nationally).
- Patient and provider background matters:** Half of Louisianans (49%) admit that they wish that their provider recognized and valued their culture and ethnicity (compared to 46% nationally). Further, Louisiana adults feel more comfortable with providers who share their background (64% vs. 54% nationally).

The Value of Physician Associates/Assistants

Positive patient-provider relationships are crucial to keeping people active within the healthcare system, bolstering faith in the system, and improving health outcomes overall.

- Primary care:** At a national level, more than four-fifths of adults (86%) have a primary care provider, while 14% do not. Louisiana adults are similarly likely to have a primary care provider (88%). Those who have a primary care provider are two times more likely than those who do not to give healthcare they received in the past 12 months an A or B grade.

- Navigating the system:** More than six in 10 adults nationally who have a primary care provider (63%) say that healthcare providers help them navigate the healthcare system – compared with less than half of those who do not have a primary care provider (48%).
- Preventing health conditions:** Nationally, more than two-fifths of care coordinators (45%) agree that better primary or preventative healthcare could have prevented the health condition, injury, or major illness for the patient.

Physician associates/assistants are well-positioned to be part of the solution to the healthcare crisis in the U.S. Having an ongoing relationship with a PA further establishes and enhances these positive feelings.

- **High trust in PAs:** Nearly two-thirds of adults (64%) nationally and 6 in 10 in Louisiana (60%) say that they would trust a PA to serve as their primary care provider.
- **High marks for PA care:** Around eight in 10 adults (79% nationally and in Louisiana, respectively) who have seen a PA rate the medical care they received from a PA in the past 12 months as either good or excellent. Those who consider themselves as having an ongoing relationship with a PA are more likely to grade their recent healthcare as an A or B (89% compared with 76% who have seen a PA but do not have an ongoing relationship).

The public supports better utilizing PAs to improve the healthcare system and better address an aging population, the rise in chronic disease, and a significant healthcare workforce shortage.

- **Maximizing PA care:** Large majorities agree that PAs should be allowed to provide care to the fullest extent of their education, training, and experience (92% nationally and 91% in Louisiana, are in support).
- **Updating PA practice laws:** Majorities also support PA practice laws being updated to allow states and healthcare systems to fully utilize their healthcare workforce (91% nationally; 89% in Louisiana).

Agreement with Statements about PAs

(Among U.S. Adults)

● Somewhat Support ● Strongly Support

Unlocking the potential of all trained healthcare providers, including PAs, holds the key to enhancing patient well-being. However, maximizing this approach mandates updating PA practice laws, enabling states and healthcare systems to fully harness their workforce.

Research Method

The research was conducted online in the U.S. by The Harris Poll on behalf of The American Academy of Physician Associates among n=2,519 adults age 18+. In addition to the national sample, oversamples were collected in eighteen states including Louisiana (n=501). The survey was conducted from November 28 – December 26, 2023. Interviews were conducted in English and Spanish.

Data from the national sample was weighted by race where necessary and by gender, region, education, marital status, household size, employment, household income, language proficiency (for Hispanic respondents only), and propensity to be online to bring respondents in line with their actual proportions in the population, and then combined using a post-weight.

All sample surveys and polls, whether or not they use probability sampling, as subject to other multiple sources of error which are most often not possible to quantify or estimate, including but not limited to coverage error, error associated with nonresponse, error associated with question wording and response options, and post-survey weighting and adjustments.

Respondents for this survey were selected from among those who have agreed to participate in our surveys. The sampling precision of Harris online polls is measured by using a Bayesian credible interval. For this study, the national sample data is accurate to within +2.8 percentage points using a 95% confidence level. This credible interval will be wider among subsets of the surveyed population of interest.
