Methodology
A random sample of PAs (both members and nonmembers of AAPA) were invited to take part in a PA Pulse Survey that was conducted by the AAPA Research Department between April 25, 2020 and May 6, 2020. A total of 743 PAs responded to this survey. The overall margin of error is 3.6% (3.8% for clinically practicing PAs) at a 95% confidence level. Response rates and margins of error vary by section and breakout.

Notes About the Data
Most data tables presented here specifically report responses from PAs who indicated they have clinically practiced in the past 4 months. Many of the survey questions refer to experiences PAs have had “in the past 10 weeks” in order to cover the period of time that the COVID-19 pandemic became majorly prevalent in the United States.

On the tables that follow:
“N” refers to the number of respondents.

About the American Academy of PAs
AAPA is the national membership organization for all PAs. PAs are medical professionals who diagnose illness, develop and manage treatment plans, prescribe medications, and often serve as a patient’s principal healthcare provider. Learn more about the profession at aapa.org and engage through Facebook, LinkedIn, Instagram, and Twitter.
**Executive Summary**

Results from this PA Pulse Survey focused on clinically practicing PAs on the frontlines of COVID-19. It shows the considerable contributions of PAs and the scale at which they have had to adapt to meet the needs of patients during the COVID-19 crisis. It is the first effort to quantify the experiences of these frontline medical providers. Almost one third of PAs have had to go without necessary personal protection equipment (PPE; Table 6), and that increases to 39% for those who have treated COVID-19 patients (Table 8). There is also a sizeable portion of our nation’s healthcare capacity that stands idle, with 22% of PAs furloughed (Tables 10, 12).

The survey also reveals that the number of PAs who have changed specialties (5.9%) or practice settings (9.9%) over the last 10 weeks nearly equals the number of PAs who changed in the entire year of 2019, indicating that PAs are being rapidly redeployed in specialties and practice settings where they are needed most. Further, half of PAs have tested, treated, or diagnosed COVID-19 patients (Table 10).

“We see how quickly the PA workforce is adapting to this crisis when given the chance to contribute. AAPA applauds the 21 states that made it easier for PAs to pivot and provide care by fully or partially waiving supervision or collaboration requirements through COVID-19 executive orders or through previous emergency-related legislation or regulation.”

David E. Mittman, President and Chair of the Board of AAPA

In most states, PAs are required to have and maintain a relationship with a physician in order to practice. This is an archaic requirement that gets in the way of patient care. In March, AAPA called on all U.S. governors to include language in executive orders waiving physician supervision or collaboration requirements for PAs during a declared public health emergency or disaster. Thus far, Maine, Michigan, New Jersey, New York, Louisiana, South Dakota, Tennessee, and Virginia have done so.

More than one in five PAs (22.1%) have been furloughed due to COVID-19, while 3.7% of PAs said they had been terminated (Table 10). Nearly three in five PAs (58.7%) cited a reduction in hours worked, and 30.6% cited a reduction in base pay (Table 11).
“When one in five PAs are furloughed, that means we have highly trained medical providers forced on the sidelines when they could be on the front lines,” Mittman said. “In more than half of states there are barriers preventing a surgical PA, for example, from testing and diagnosing patients in the emergency department. More states must ease these practice restrictions so that PAs can fully contribute to the COVID-19 response.”

More than 70% of PAs are at least somewhat concerned with their health and the health of their families (Table 4). AAPA has joined other provider organizations in asking Congress and the Administration for more PPE for frontline healthcare workers and will continue to do so during the pandemic.

"Our nation’s leaders need to understand the scale of the challenges that healthcare providers are experiencing on the frontlines. As the professional organization representing PAs, our duty is to advocate for the health and well-being of every individual who chooses to serve."

David E. Mittman, President and Chair of the Board of AAPA

About PAs
PAs are highly trained and qualified medical professionals, who diagnose illness, develop, and manage treatment plans, prescribe medications, and often serve as a patient’s principal healthcare provider. They are educated at the master’s degree level in the medical model over a 27-month-long period. There are more than 140,000 PAs in the U.S. who work in all medical settings and specialties. To learn more about PAs, go to aapa.org.
The American Academy of PAs (AAPA) conducted a survey with a random sample of PAs over a 12-day period from April 25 to May 6, 2020. These survey results reflect PA respondents who indicated they have clinically practiced in the last four months.
