

# Racial, Ethnic, and Gender Differences in Acute Pain Management in the Emergency Department

Kimberly Sapre, MMS, PA-C

Doctor of Medical Science student

A.T. Still University

Emergency Medicine PA

Inova Fairfax Hospital

# Learning Objectives

---

At the conclusion of this session, participants should be able to:

1. Define implicit bias and identify how it affects acute pain treatment in the emergency department
2. Articulate how racial/ethnic minorities and women experience different acute pain treatment in the emergency department

## Introduction

- 1.7 million visits to emergency departments
- 42% of visits were for acute pain
- Most common chief complaints
  - Abdominal pain (8.8%)
  - Chest pain (4.7%)

# Background

---

- Clinicians may be unaware of biases
- Emergency medicine clinicians may be more susceptible
  - Fast-paced, chaotic environment with multiple interruptions
  - Patients unknown to the clinicians
  - High patient load with varying complaints possibly life-threatening
- Clinicians rely on cognitive heuristics (“gut-instinct”)

- 
- The research aimed to review the acute pain treatment of racial/ethnic minorities and women to determine if treatment differences exist
  - Level 1 Trauma Center in northern Virginia

# Research Methods

---

- Retrospective chart review of adult emergency department visits
- Chief complaint of abdominal pain
- Exclusion criteria
  - Patients < 18 years old
  - CODE STEMI (ST-elevated myocardial infarction), CODE stroke, trauma team activations
  - Pregnant patients, patients treated for chronic pain, patients with psychiatric/substance abuse diagnoses
  - Pain score of zero
  - Missing data for pain score, gender, and both race/ethnicity

# Research Methods (continued)

---

- Race – White, Black, Asian, or Other
- Ethnicity – Hispanic/Latino or Non-Hispanic/Latino
- Gender – male or female
- Pain score – 1 to 10
- Pain medications – nonopioid and opioid
- Exempt human research study by the Inova Health System Institutional Review Board (IRB) #U20-04-4010 and the A.T. Still University-Arizona IRB #2020-123.

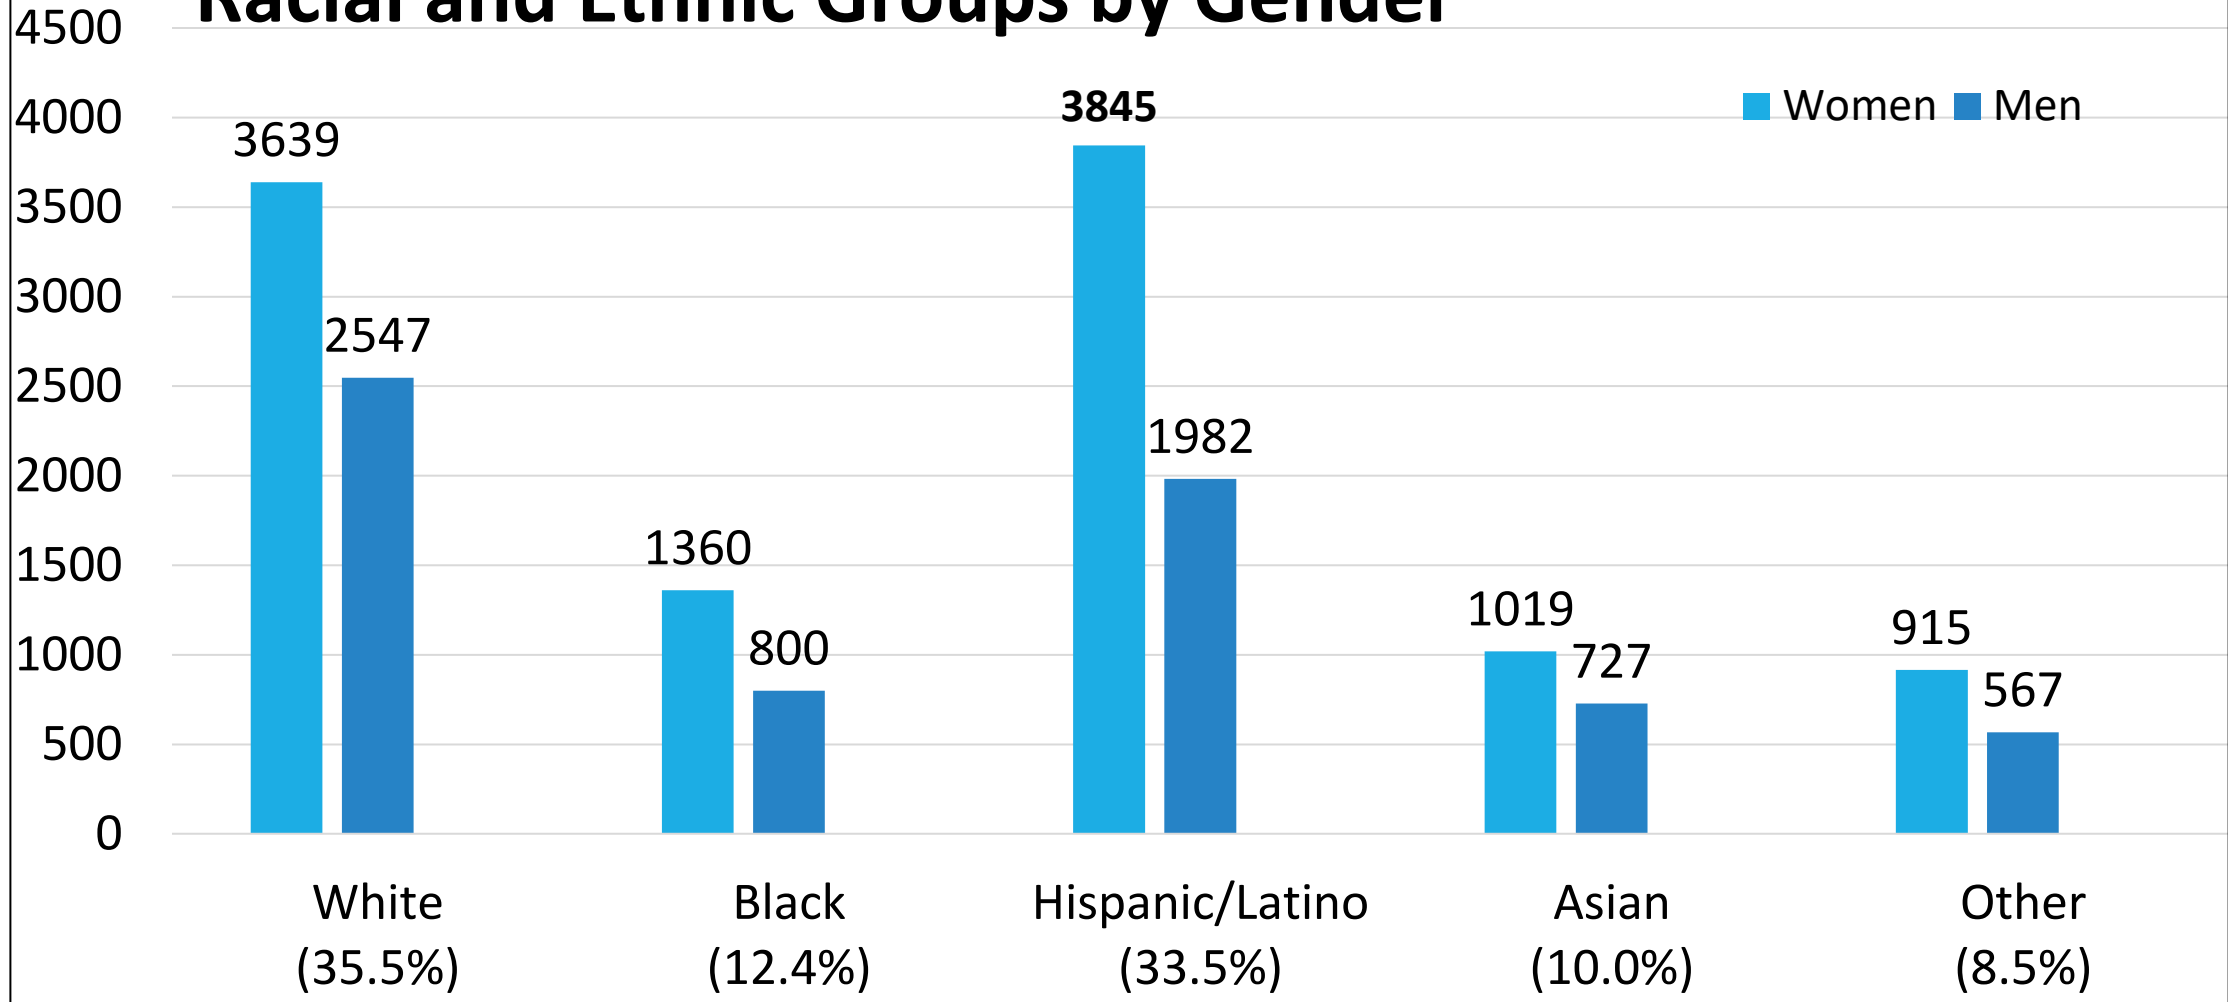

# Age Groups

■ 18 - 44 ■ 45 - 74 ■  $\geq 75$

# Racial and Ethnic Groups by Gender

## Descriptive Data

|                            | Total        | Racial/Ethnic Groups |       |                     |       |       | Gender |       |
|----------------------------|--------------|----------------------|-------|---------------------|-------|-------|--------|-------|
|                            |              | White                | Black | Hispanic/<br>Latino | Asian | Other | Men    | Women |
| <b>Arrival Method</b>      |              |                      |       |                     |       |       |        |       |
| <b>Personal Vehicle</b>    | <b>88.3%</b> | 29.2%                | 10.7% | 32.0%               | 8.7%  | 7.7%  | 33.3%  | 55.0% |
| <b>Ambulance</b>           | 11.5%        | <b>6.3%</b>          | 1.6%  | 1.4%                | 1.4%  | 0.8%  | 4.6%   | 6.9%  |
| <b>Acuity Level</b>        |              |                      |       |                     |       |       |        |       |
| <b>2</b>                   | 12%          | 5.6%                 | 1.4%  | 2.7%                | 1.5%  | 0.8%  | 5.5%   | 6.5%  |
| <b>3</b>                   | <b>87.4%</b> | 29.8%                | 10.9% | 30.7%               | 8.4%  | 7.6%  | 32.2%  | 55.2% |
| <b>Discharge Home</b>      | <b>68.3%</b> | 21.6%                | 9.0%  | 24.9%               | 6.4%  | 6.4%  | 24.0%  | 44.3% |
| <b>Hospital Admission*</b> | 31.1%        | 13.7%                | 3.3%  | 8.5%                | 3.6%  | 2.0%  | 13.8%  | 17.3% |

\*Includes patients admitted to the operating room, admitted for observation/inpatient admission, and transferred to another facility

# Top Ten Diagnoses

| Diagnosis<br>(% of total patients)        | Gender |                   |      | Pain Treatment                        |                            |
|-------------------------------------------|--------|-------------------|------|---------------------------------------|----------------------------|
|                                           | Total  | Women             | Men  | Received Pain Medication <sup>h</sup> | Received Opioid Medication |
| <b>Abdominal Pain<sup>a</sup> (34.8%)</b> | 6051   | 3990 <sup>g</sup> | 2061 | 3356                                  | 2182                       |
| Colitis <sup>b</sup> (6.9%)               | 1201   | 659 <sup>g</sup>  | 542  | 737                                   | 536 <sup>i</sup>           |
| NVD (4.8%)                                | 839    | 535               | 304  | 353                                   | 191 <sup>i</sup>           |
| <b>Appendicitis (4.6%)</b>                | 805    | 349 <sup>g</sup>  | 456  | 547                                   | 445 <sup>i</sup>           |
| Kidney Stones (3.9%)                      | 678    | 271 <sup>g</sup>  | 407  | 590                                   | 294 <sup>i</sup>           |
| Cholelithiasis (3.5%)                     | 613    | 435 <sup>g</sup>  | 178  | 436                                   | 349 <sup>i</sup>           |
| UTI <sup>e</sup> (3.2%)                   | 559    | 460               | 99   | 292                                   | 127 <sup>i</sup>           |
| Bowel Obstruction <sup>f</sup> (3.2%)     | 562    | 293               | 269  | 434                                   | 413 <sup>i</sup>           |
| Ovarian Cyst (2.7%)                       | 475    | 474 <sup>g</sup>  | 1    | 353                                   | 162 <sup>i</sup>           |
| <b>Cholecystitis (2.3%)</b>               | 398    | 263               | 135  | 306                                   | 256 <sup>i</sup>           |

a – includes intestinal colic, inguinal pain, groin pain, abdominal discomfort/distention/bloating/cramping

b – includes ulcerative colitis, Crohn disease, diverticulitis, enteritis

c – nausea, vomiting, and/or diarrhea

d – includes biliary colic, choledocholithiasis, biliary obstruction, common bile duct dilatation

e – includes dysuria

f – includes partial bowel obstruction

Chi-square test of independence results:

g – Significant difference between genders (p < 0.001)

h – Significant difference between received and did not receive pain medication (p < 0.001)

i – Significant difference between nonopioid and opioid treatment (p < 0.001)

Abbreviation: NVD – nausea, vomiting, diarrhea; UTI - urinary tract infection

## Racial Group Pain Treatment

Means with 95% Confidence Interval

|                        | Arrival to Medication<br>(minutes) | Number of<br>Medications Given | Length of Stay<br>(minutes) |
|------------------------|------------------------------------|--------------------------------|-----------------------------|
| <b>White</b>           | 92.69 (90.03-95.35)                | <b>1.01 (0.98-1.03)*</b>       | 335.29 (331.15-339.43)      |
| <b>Black</b>           | 97.27 (92.74-101.80)               | 0.93 (0.88-0.97)*              | 320.20 (313.33-327.07)*     |
| <b>Hispanic/Latino</b> | <b>100.22 (97.55-102.88)**</b>     | 0.90 (0.88-0.93)*              | 313.17 (309.42-316.92)*     |
| <b>Asian</b>           | 99.08 (93.43-104.74)               | 0.84(0.79-0.88)*               | 334.59 (326.47-342.70)      |
| <b>Other</b>           | 92.50 (87.19-97.81)                | 0.88 (0.83-0.93)*              | 305.42 (297.93-312.91)*     |

\*Significant difference between White versus minority racial groups (p<0.05)

\*\* Significant difference between Hispanic/Latino versus White patients (p<0.05)

## Opioid versus Nonopioid Medication

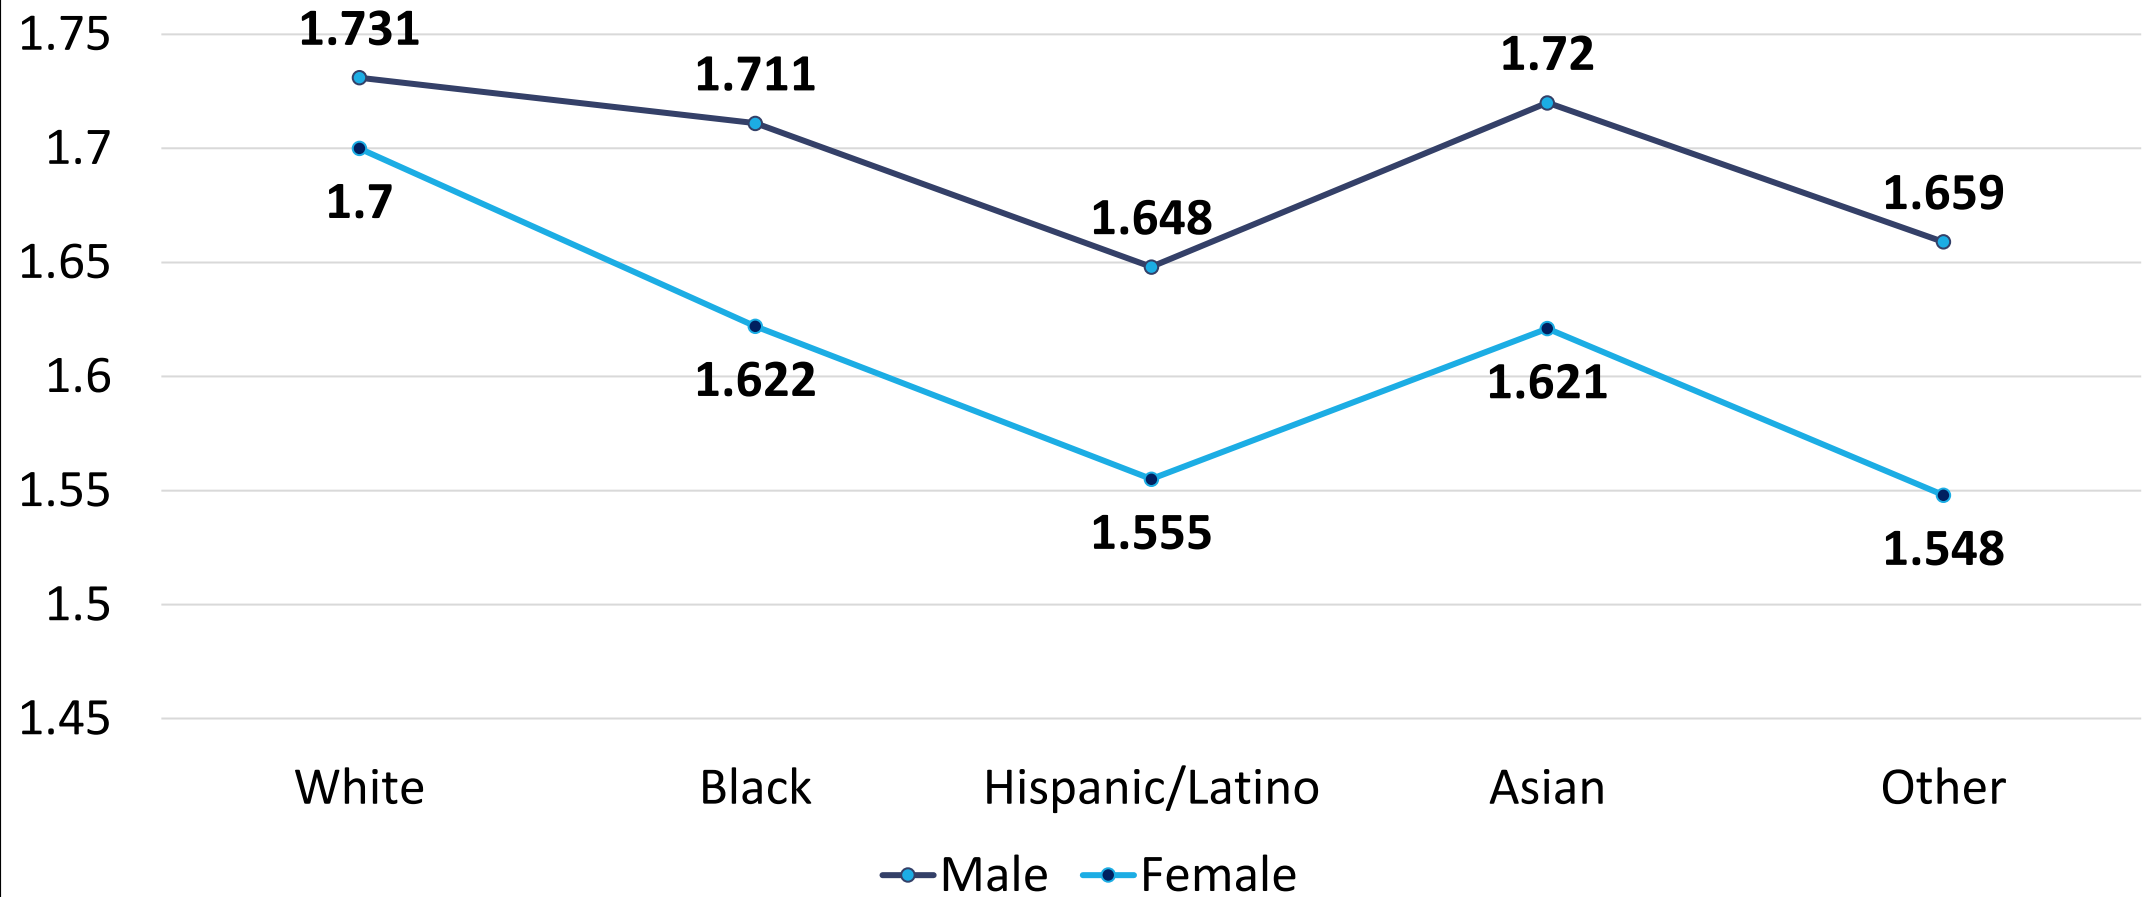

## Medications Given by Gender

|       | Medication<br>Given | Received<br>Opioid | p-value*      |
|-------|---------------------|--------------------|---------------|
|       |                     |                    | 0.001         |
| Women | 6464                | 61.9%              | 4113<br>61.7% |
| Men   | 3972                | 56.9%              | 2623<br>69.6% |

\*Chi-square test of significance  $p < 0.05$

## Means of Medication Given

# Treatment Differences

---

- White patients received more pain medications and received opioids more often
- Hispanic/Latino patients waited 6.35 minutes longer for pain medications
- Women patients waited 9 minutes longer for pain medications
- Women less likely to receive an opioid medication
- Unexpected results
  - Women received more pain medications during the emergency department visit
  - White patients had a longer length of stay than racial/ethnic minority patients
  - Hispanic/Latino patients received more pain prescriptions at discharge

# Limitations

---

- Racial and gender concordance not evaluated
- Pain treatment restricted to nonopioid and opioid pain medications
- No documentation of pain medications taken prior to arrival or given by emergency medical technicians during transport

Why do treatment  
differences exist?

---

- Opioid Epidemic
- Communication Barriers
- Pregnancy tests

## Racial/Ethnic Biases

- Biases persists because of systemic and structural racism
- Black patients
  - Legacy of discrimination set conditions for racial bias
- Hispanic/Latino patients
  - Equating the population with undocumented immigrants regardless of immigration status
- Asian patients
  - History of exclusionary immigration laws, forced migration, and internment

## Gender Biases

- Female gender norms
  - Emotional
  - Hysterical
  - Complaining
  - Malingering
  - More likely to have psychological causes than somatic causes
- Male gender norms
  - Stoic
  - Tolerating pain
  - Avoid seeking health care

# Strategies

**Introspection**

**Perspective-  
Taking**

**Individuation**

**Learn to Slow  
Down**

**Cultural  
Humility**

**Institutionalize  
Fairness**

## Take Home Points

- Unconscious biases may affect acute pain treatment of patients
- Unconscious biases rooted in historical discrimination and persistent systemic biases of minority patients and women
- It is imperative to be aware of biases, and work to overcome the automatic associations
