# Disclosures

I **may** discuss off label use in my presentation

I **have no** financial relationships to disclose.

# Objectives

## Overview

Hypertension is a disease with major implications for our patients' short- and long-term health journey.

We will review updated guideline-directed management strategies and concepts in anti-hypertension treatment. This will be done in the context of:

- 1) Review primary and secondary risk factors associated with development of hypertension
- 2) Understanding the complications, disease manifestations, and/or sequelae of hypertension
- 3) Identifying common co-morbid conditions (e.g., diabetes, coronary artery disease, chronic kidney disease, etc.)
- 4) Review the available non-pharmacologic and pharmacologic approaches and management strategies for usual and resistant hypertension
- 5) Discuss and review the importance of context, e.g., the patient's co-morbid conditions, age, ethnicity, and health values, on initial approaches of both non-pharmacologic and pharmacologic management of hypertension.

# Objectives

At the conclusion of this session, participants should be able to:

- Recognize how to approach hypertension as a systemic disease, its multiple manifestations/sequelae, associated diseases/risk factors, and how co-existing conditions impact when and what anti-hypertensive medications classes/agents to initiate first.
- Identify and apply aggressive risk management strategies for patients with resistant hypertension
- Recognize old versus new concepts in the approach to treating hypertension
- Recognize the initial approach and non-pharmacologic management of patients with hypertension

# Blood Pressure Physiology

In simplest terms...

Blood Pressure

Cardiac Output

Peripheral Vascular  
Resistance

Heart Rate

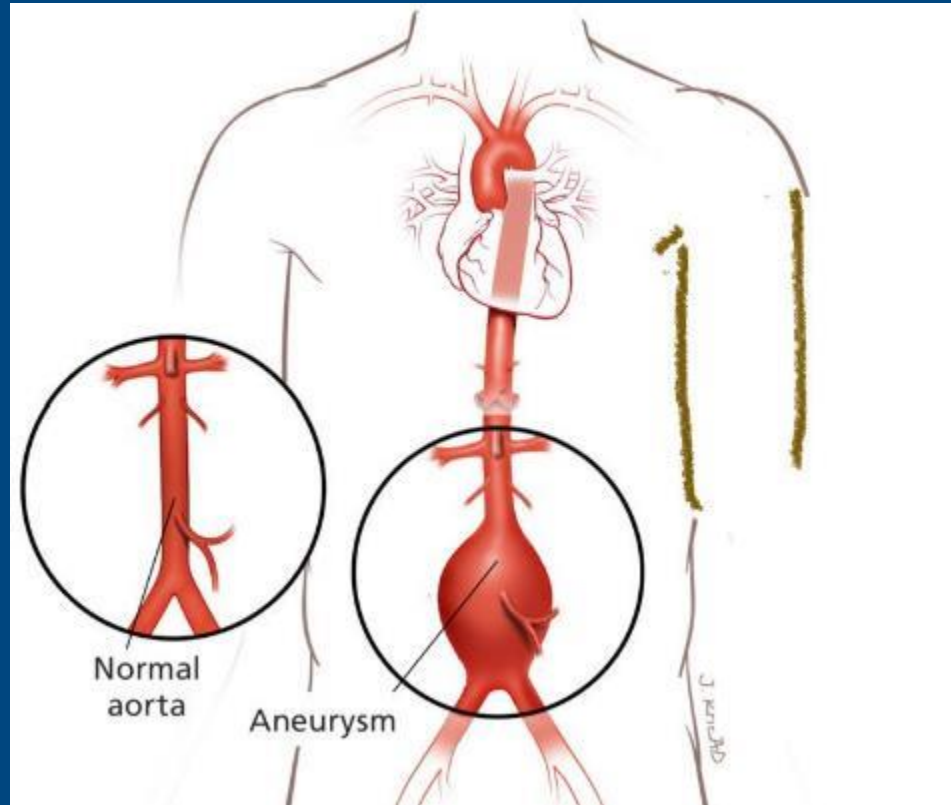

Stroke Volume

# Pressure, a force for good and bad

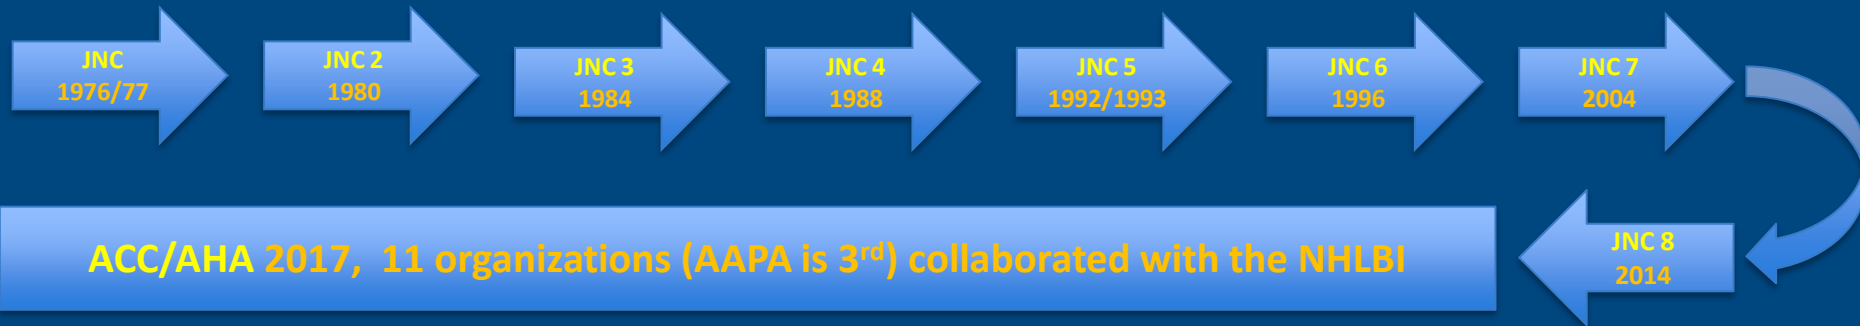

# Pressure, a force for good and bad

# Level Setting Hypertension

Which guidelines to use?

## The National High Blood Pressure Education Program (NHBPEP)

**JNC** Task Force I NHBPEP, NHLBI "Report of the Joint National Committee on Detection, Evaluation, and Treatment of High Blood Pressure. A cooperative study. JAMA. 1977;237(3):255-261."

**JNC 2** "The 1980 report of the Joint National Committee on Detection, Evaluation, and Treatment of High Blood Pressure. Arch Intern Med. 1980;140(10):1280-1285."

**JNC 3** "The 1984 Report of the Joint National Committee on Detection, Evaluation, and Treatment of High Blood Pressure. Arch Intern Med. 1984;144:1045-1057."

**JNC 4** "The 1988 report of the Joint National Committee on Detection, Evaluation, and Treatment of High Blood Pressure. Arch Intern Med. 1988;148:1023-1038."

**JNC 5** "The fifth report of the Joint National Committee on Detection, Evaluation, and Treatment of High Blood Pressure (JNC V). Arch Intern Med. 1993;153:154-183."

**JNC 6** "The sixth report of the Joint National Committee on prevention, detection, evaluation, and treatment of high blood pressure. Arch Intern Med. 1997;157:2413-2446."

**JNC 7** "The Seventh Report of the Joint National Committee on Prevention, Detection, Evaluation, and Treatment of High Blood Pressure: the JNC 7 report. JAMA. 2003;289:2560-2572."

**JNC 8** "2014 evidence-based guideline for the management of high blood pressure in adults: report from the panel members appointed to the Eighth Joint National Committee (JNC 8). JAMA."

**ACC/AHA** "2017 ACC/AHA/AAPA/ABC/ACPM/AGS/APhA/ASH/ASPC/NMA/PCNA Guideline for the Prevention, Detection, Evaluation, and Management of High Blood Pressure in Adults: A Report of the American College of Cardiology/American Heart Association Task Force on Clinical Practice Guidelines [published correction appears in J Am Coll Cardiol. 2018 May 15;71(19):2275-2279]. J Am Coll Cardiol. 2018;71(19):e127-e248. doi:10.1016/j.jacc.2017.11.006"

# Differences in HTN categories

JNC 7, JNC 8, and ACC/AHA 2017

**2017 Guideline for the Prevention, Detection, Evaluation and Management of High Blood Pressure in Adults**

## **BP Classification (JNC 7 and ACC/AHA Guidelines)**

| SBP     |     | DBP   | JNC 7                | 2017 ACC/AHA         |
|---------|-----|-------|----------------------|----------------------|
| <120    | and | <80   | Normal BP            | Normal BP            |
| 120–129 | and | <80   | Prehypertension      | Elevated BP          |
| 130–139 | or  | 80–89 | Prehypertension      | Stage 1 hypertension |
| 140–159 | or  | 90–99 | Stage 1 hypertension | Stage 2 hypertension |
| ≥160    | or  | ≥100  | Stage 2 hypertension | Stage 2 hypertension |

- Blood Pressure should be based on an average of  $\geq 2$  careful readings on  $\geq 2$  occasions
- Adults being treated with antihypertensive medication designated as having hypertension

# The short case for adoption of 2017 AHA/ACC BP guidelines

- The risk of CVD doubles for every 20/10 mmHg over 115/75\* → 2x risk of CV event AT 135/85
- JNC 7/8 Guidelines **Stage I HTN** = ≥140/≥90

Thus: antihypertensive therapies were being considered **AFTER** patients are already ≥2x risk of CV Event

# Differences in HTN goals

JNC 7, JNC 8, and ACC/AHA 2017

TABLE 2

Recommended BP goals according to JNC 7, JNC 8, and 2017 ACC/AHA guidelines<sup>1,2,6</sup>

| Patient group  | JNC 7                       | JNC 8                      | 2017 ACC/AHA            |
|--|-----------------------------|----------------------------|-------------------------|
| General                 | <140/90 mm Hg               | <140/90 mm Hg              | <130/80 mm Hg*          |
| Older patients          | <140/90 mm Hg               | <150/90 mm Hg <sup>†</sup> | <130 mm Hg <sup>‡</sup> |
| Diabetes                | <del>&lt;130/80 mm Hg</del> | <140/90 mm Hg              | <130/80 mm Hg           |
| Chronic kidney disease  | <del>&lt;130/80 mm Hg</del> | <140/90 mm Hg              | <130/80 mm Hg           |

ACC, American College of Cardiology; AHA, American Heart Association; BP, blood pressure; JNC 7, Seventh Report of the Joint National Committee; JNC 8, Eighth Joint National Committee.

\*Includes patients with atherosclerotic cardiovascular disease (ASCVD) or an estimated 10-year risk  $\geq 10\%$ , as well as patients needing primary prevention or those with 10-year ASCVD risk  $< 10\%$ .

<sup>†</sup>General population  $\geq 60$  years of age. Treatment does not need to be adjusted in patients  $\geq 60$  years who may have lower systolic BP (eg,  $< 140$  mm Hg) and are not experiencing adverse effects.

<sup>‡</sup>Ambulatory, community-dwelling, noninstitutionalized patients  $\geq 65$  years of age. Clinical judgment, patient preference, and a team-based approach to assess benefits and risks are reasonable for patients with a high burden of comorbidity and limited life expectancy.

|                           | SBP/DBP $\geq$ 130/80 mm Hg or Self-Reported Antihypertensive Medication† |                | SBP/DBP $\geq$ 140/90 mm Hg or Self-Reported Antihypertensive Medication‡ |                |
|---------------------------|---|----------------|---|----------------|
| Overall, crude            | 46%   |                | 32%   |                |
|                           | Men (n=4717)  | Women (n=4906) | Men (n=4717)  | Women (n=4906) |
| Overall, age-sex adjusted | 48%   | 43%            | 31%   | 32%            |
| <b>Age group, y</b>       |   |                |   |                |
| 20–44                     | 30%   | 19%            | 11%   | 10%            |

| 75+                       | 79%   | 85%            | 71%   | 78%            |
| <b>Race-ethnicity§</b>    |   |                |   |                |
| Non-Hispanic white        | 47%   | 41%            | 31%   | 30%            |
| Non-Hispanic black        | 59%   | 56%            | 42%   | 46%            |
| Non-Hispanic Asian        | 45%   | 36%            | 29%   | 27%            |
| Hispanic                  | 44%   | 42%            | 27%   | 32%            |

# Definition of Hypertension - Primary

## What is ESSENTIAL? Cookie baking ingredients ;)

### BAKING POWDER

- gives cookies an artificial, chemical flavor
- results in Play-Doh texture

### TOO MUCH FLOUR

- makes cookies dry, crumbly, and chalky

### OVER-CREAMED

- cookies become tough and hard

### NO EGGS

- taste too sweet
- cookies are dry on the outside and doughy on the inside

### EVERYTHING MIXED TOGETHER AT ONCE

- results in inconsistent texture and flavor

### NOT ENOUGH FLOUR

- cookies burn easily
- too much grease

### NOT ENOUGH SUGAR

- tastes like shortbread
- cookies are dry on the outside and doughy on the inside

### OVER-BAKED

- cookies are dry and crumbly
- results in a toasted flavor

# Definition of Hypertension - Primary

What is ESSENTIAL? I would argue while pressure is essential, hypertension is NOT

Low Pressure

Low Pressure

High Pressure

# Definition of Hypertension - Primary

What is ESSENTIAL? I would argue while pressure is essential, hypertension is NOT

- “Essential” - an older term based upon a hypothesis that as we age, our vasculature becomes stiffer, and that higher and higher blood pressures are required to maintain optimal cardiac output.
- Primary - sustained blood pressures meeting criteria (e.g., ACC/AHA 2017) for hypertension related to multiple genetic and environmental factors.

| <b>Blood Pressure Categories</b>                         |                                  |        |                                   |  |
|--|----------------------------------|--------|-----------------------------------|---|
| BLOOD PRESSURE CATEGORY                                  | SYSTOLIC mm Hg<br>(upper number) |        | DIASTOLIC mm Hg<br>(lower number) |   |
| NORMAL   | LESS THAN 120                    | and    | LESS THAN 80                      |   |
| ELEVATED   | 120 - 129                        | and    | LESS THAN 80                      |   |
| HIGH BLOOD PRESSURE<br>(HYPERTENSION) STAGE 1            | 130 - 139                        | or     | 80 - 89                           |   |
| HIGH BLOOD PRESSURE<br>(HYPERTENSION) STAGE 2            | 140 OR HIGHER                    | or     | 90 OR HIGHER                      |   |
| HYPERTENSIVE CRISIS<br>(consult your doctor immediately) | HIGHER THAN 180                  | and/or | HIGHER THAN 120                   |   |

# Hypertension is Essential? I think not.

## SPRINT Trial

Table 1. Baseline Characteristics of the Study Participants.<sup>a</sup>

| Characteristic  | Intensive Treatment<br>(N=4678) | Standard Treatment<br>(N=4683) |
|---|---------------------------------|--------------------------------|
| Criterion for increased cardiovascular risk — no. (%)†  |                                 |                                |
| Age ≥75 yr  | 1317 (28.2)                     | 1319 (28.2)                    |
| Chronic kidney disease‡                                 | 1330 (28.4)                     | 1316 (28.1)                    |
| Cardiovascular disease                                  | 940 (20.1)                      | 937 (20.0)                     |
| Clinical  | 779 (16.7)                      | 783 (16.7)                     |
| Subclinical   | 247 (5.3)                       | 246 (5.3)                      |
| Framingham 10-yr cardiovascular disease risk score ≥15% | 3556 (76.0)                     | 3547 (75.7)                    |
| Female sex — no. (%)                                    | 1684 (36.0)                     | 1648 (35.2)                    |
| Age — yr  |                                 |                                |
| Overall   | 67.9±9.4                        | 67.9±9.5                       |
| Among those ≥75 yr of age                               | 79.8±3.9                        | 79.9±4.1                       |

### INTENSIVE BLOOD PRESSURE MANAGEMENT MAY SAVE LIVES

**WHAT'S THE BEST WAY TO TREAT HIGH BLOOD PRESSURE IN PATIENTS 50 AND OLDER?**  
The SPRINT trial enrolled more than 9,300 participants at UAB and other locations to find out. Investigators divided them into two groups:

#### STANDARD TREATMENT

THERAPY:

Avg. 2 different blood pressure medications

#### INTENSIVE TREATMENT

THERAPY: ✓

Avg. 3 different blood pressure medications

**RESULTS:** ABOUT **30%** lower rates of heart attack, heart failure, and other cardiovascular events, ABOUT **25%** lower risk of death among participants receiving intensive treatment

UAB THE UNIVERSITY OF ALABAMA AT BIRMINGHAM

# Primary Hypertension

Primary - Factors that contribute:

Age

Obesity

Family History (2x more common in those w/at least 1 parent with HTN)

Race

High Na+ Diet

Excessive EtOH

Sedentary lifestyle

Reduced nephron number (acquired or genetic)

# Secondary Hypertension

Secondary - Identifiable cause or contributor to Hypertension

Simplest definition and discovery of secondary hypertension:

- If you treat the primary disease to control, remission, or cure, the hypertension will resolve.

# Definition of Hypertension - Secondary

Secondary - HTN with an identifiable cause or contributor

1. Rx or OTC meds (e.g., NSAIDs, certain weight loss meds, etc.)
2. Primary renal disease
3. Primary aldosteronism
4. Renovascular HTN (e.g., fibromuscular dysplasia, atherosclerosis, etc.)
5. Obstructive or central sleep apnea
6. Pheochromocytoma
7. Cushing's syndrome
8. Other endocrine dysfunction (hypo- hyperthyroidism, etc.)
9. Coarctation of the Aorta
10. Etc.

# Complications, Manifestations, Sequelae

## Target Organ Damage

- **Brain** – CVA/TIA
- **Eyes** – Retinopathy
- **Heart** – LVH, CHD, HF, arrhythmias
- **Kidneys** – nephropathy
- **Arteries** – Peripheral Vascular disease

# Complications, Manifestations, Sequelae

**Hypertensive Headache?** Not common, can occur...Caveats

- A few small studies suggest that incidence of hypertensive related headache between 15-20% when diastolic BP was between 95 – 125 mmHg, incidence up to 55% when diastolic BP was  $\geq 110$  mmHg\*
- American Heart Association – Hypertensive Headaches can occur when BP  $\geq 180/\geq 120$

**Symptom-wise, remember, there is a reason  
Hypertension is called the “silent killer”**

# Common Travel Companions

Complications from Hypertension or Co-Morbid Conditions

| Modifiable Factors/Conditions                 | Relatively Fixed Factors/Conditions  |
|---|--------------------------------------|
| Current cigarette smoking, secondhand smoking | CKD                                  |
|   | Family History                       |
| Diabetes Mellitus                             | Increased Age                        |
| Dyslipidemia/Hypercholesterolemia             | Low Socioeconomic/Educational Status |
| Overweight/Obesity                            | Male Sex                             |
| Physical Inactivity/Low Fitness               | Obstructive Sleep Apnea              |
| Unhealthy Diet                                | Psychosocial Stress                  |

# Common travel companions

## Complications from hypertension or Co-Morbid Conditions

Regardless of whether a complication from previously untreated, uncontrolled hypertension or whether a co-morbid condition, the presence of diabetes, chronic kidney disease, atherosclerotic cardiovascular disease, etc. will provide context for the pharmacologic therapy deployed alongside baseline lifestyle modifications recommended.

# HTN goals ACC/AHA 2017

| Patient group          | 2017 ACC/AHA            |
|------------------------|-------------------------|
| General                | <130/80 mm Hg*          |
| Older patients         | <130 mm Hg <sup>†</sup> |
| Diabetes               | <130/80 mm Hg           |
| Chronic kidney disease | <130/80 mm Hg           |

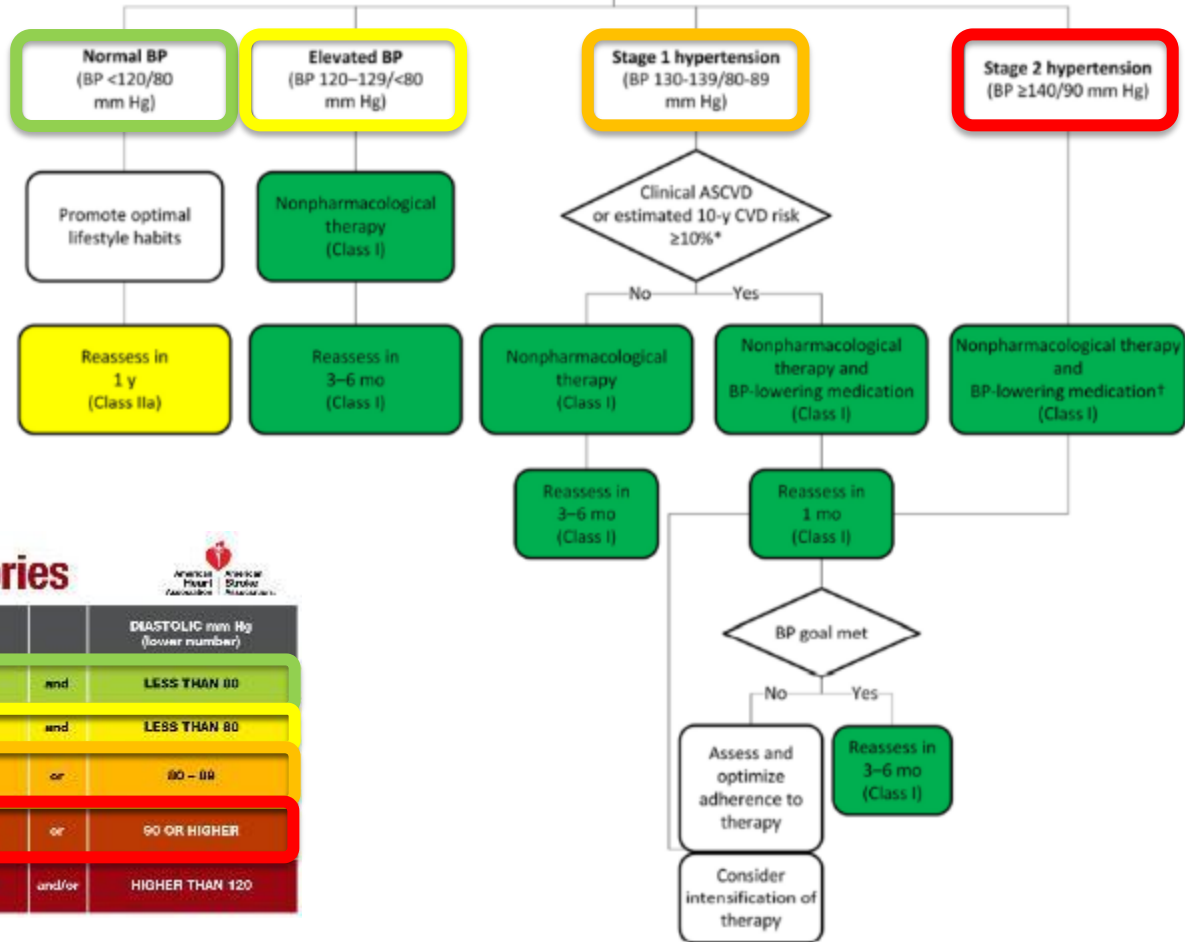

\*Includes patients with atherosclerotic cardiovascular disease (ASCVD) or an estimated 10-year risk  $\geq 10\%$ , as well as patients needing primary prevention or those with 10-year ASCVD risk  $< 10\%$ .

<sup>†</sup>General population  $\geq 60$  years of age. Treatment does not need to be adjusted in patients  $\geq 60$  years who may have lower systolic BP (eg,  $< 140$  mm Hg) and are not experiencing adverse effects.

<sup>‡</sup>Ambulatory, community-dwelling, noninstitutionalized patients  $\geq 65$  years of age. Clinical judgment, patient preference, and a team-based approach to assess benefits and risks are reasonable for patients with a high burden of comorbidity and limited life expectancy.

BP thresholds and recommendations for treatment and follow-up

## Blood Pressure Categories

| BLOOD PRESSURE CATEGORY                                  | SYSTOLIC mm Hg<br>(upper number) |        | DIASTOLIC mm Hg<br>(lower number) |
|--|----------------------------------|--------|-----------------------------------|
| NORMAL   | LESS THAN 120                    | and    | LESS THAN 80                      |
| ELEVATED   | 120 - 129                        | and    | LESS THAN 80                      |
| HIGH BLOOD PRESSURE<br>(HYPERTENSION) STAGE 1            | 130 - 139                        | or     | 80 - 89                           |
| HIGH BLOOD PRESSURE<br>(HYPERTENSION) STAGE 2            | 140 OR HIGHER                    | or     | 90 OR HIGHER                      |
| HYPERTENSIVE CRISIS<br>(consult your doctor immediately) | HIGHER THAN 180                  | and/or | HIGHER THAN 120                   |

| Blood Pressure Category                    | Systolic mmHg (upper number) |     | Diastolic mmHg (lower number) | Lifestyle/Nonpharmacological therapy | 10-year ASCVD Risk Score (< or ≥ 10%) | BP Lowering Medications  | Reassess             | BP Goal Met (Yes/No) |  |
|--|------------------------------|-----|-------------------------------|--------------------------------------|---------------------------------------|--|----------------------|----------------------|--|
| NORMAL                                     | < 120                        | And | < 80                          | Promote optimal Lifestyle Habits     | No need to calculate                  | -  | 1 year (Class IIa)   | Yes                  | Ongoing Surveillance and measurement.  |

# Atherosclerotic Cardiovascular Disease (ASCVD)

Stroke, coronary artery disease/myocardial infraction, peripheral artery disease.

## Needed information

- Age
- Sex
- Race
- SBP
- DBP
- Total cholesterol
- HDL
- Y/N DM I or II
- Y/N Smoking
- Y/N HTN

App should be used for primary prevention patients (those without ASCVD) only.

# Lifestyle first and foremost

Its about the quality of life we live, not just how long we live it

Consider discussing lifestyle modifications not as “work” you do to become healthy. Rather as doing enjoyable activities by yourself or with others that happen to help keep you feeling healthy.

# Lifestyle first and foremost

Strongest Recommendation (I), highest level of evidence (Level A)

**Table 15. Best Proven Nonpharmacological Interventions for Prevention and Treatment of Hypertension\***

|                                      | Nonpharmacological Intervention | Dose   | Approximate Impact on SBP |              |                 |
|--------------------------------------|---------------------------------|--|---------------------------|--------------|-----------------|
|                                      |                                 |  | Hypertension              | Normotension | Reference       |
| Weight loss                          | Weight/body fat                 | Best goal is ideal body weight, but aim for at least a 1-kg reduction in body weight for most adults who are overweight. Expect about 1 mm Hg for every 1-kg reduction in body weight. | -5 mm Hg                  | -2/3 mm Hg   | S6.2-1          |
| Healthy diet                         | DASH dietary pattern            | Consume a diet rich in fruits, vegetables, whole grains, and low-fat dairy products, with reduced content of saturated and total fat.  | -11 mm Hg                 | -3 mm Hg     | S6.2-6,S6.2-7   |
| Reduced intake of dietary sodium     | Dietary sodium                  | Optimal goal is <1500 mg/d, but aim for at least a 1000-mg/d reduction in most adults.   | -5/6 mm Hg                | -2/3 mm Hg   | S6.2-9,S6.2-10  |
| Enhanced intake of dietary potassium | Dietary potassium               | Aim for 3500-5000 mg/d, preferably by consumption of a diet rich in potassium.   | -4/5 mm Hg                | -2 mm Hg     | S6.2-13         |

# Weight/Body Fat loss → -5 mmHg

Loss of 1 kg = ~ -1 mmHg

BMI tells “a” story, just not the full one.

Consider also body fat/composition assessment.

Discuss weight loss as a “journey”. Most don’t suddenly find themselves heavier, don’t expect weight loss to be sudden either.

|        | Healthy Weight     |     |     |     |     | Overweight |     |     |     |     | Obese |     |     |     |     |     |     |

# DASH Eating Plan → -11 mmHg

| Food Group                         | Daily Servings  |
|------------------------------------|-----------------|
| Grains                             | 6–8             |
| Meats, poultry, and fish           | 6 or less       |
| Vegetables                         | 4–5             |
| Fruit                              | 4–5             |
| Low-fat or fat-free dairy products | 2–3             |
| Fats and oils                      | 2–3             |
| Sodium                             | 2,300 mg*       |
|                                    | Weekly Servings |
| Nuts, seeds, dry beans, and peas   | 4–5             |
| Sweets                             | 5 or less       |

Simply Stated:

Eat **MORE**: Fruits, Vegetables, Whole Grains, Unsaturated Fats & Oils, Lean Proteins and Low-Fat Dairy

Eat **LESS**: Saturated Fats and Sugars

## DASH Eating Plan

The Benefits: Lowers blood pressure & LDL "bad" cholesterol.

|  Eat This                  |  Limit This                |
|---|---|
|  Vegetables                |  Fatty meats               |
|  Fruits                    |   |
|  Whole grains              |  Full-fat dairy            |
|  Fat-free or low-fat dairy |   |
|  Fish                      |  Sugar sweetened beverages |
|  Poultry                   |   |
|  Beans                     |  Sweets                    |
|  Nuts & seeds              |   |
|  Vegetable oils            |  Sodium intake             |

Intermountain Medical Center

Reduce Sodium → **-5/6 mmHg**

# Reduce Sodium

Physical Activity → **-4 to 8 mmHg**

No matter the desire and knowledge, it still takes motivation

# American Heart Association Physical Activity Recommendations

 American Heart Association  
American Stroke Association  
*Life is why.*

## The American Heart Association Recommendations for Physical Activity in Adults

For Overall Cardiovascular Health:

At least **30** minutes of moderate-intensity aerobic activity

At least **5** days per week for a total of **150** minutes

OR

At least **25** minutes of vigorous aerobic activity

At least **3** days per week for a total of **75** minutes

or a combination of the two

**AND**

Moderate to **HIGH INTENSITY** muscle-strengthening activity

At least **2** days per week for additional health benefits

## For Lowering Blood Pressure and Cholesterol:

An average of **40** minutes of moderate-to-vigorous-intensity aerobic activity

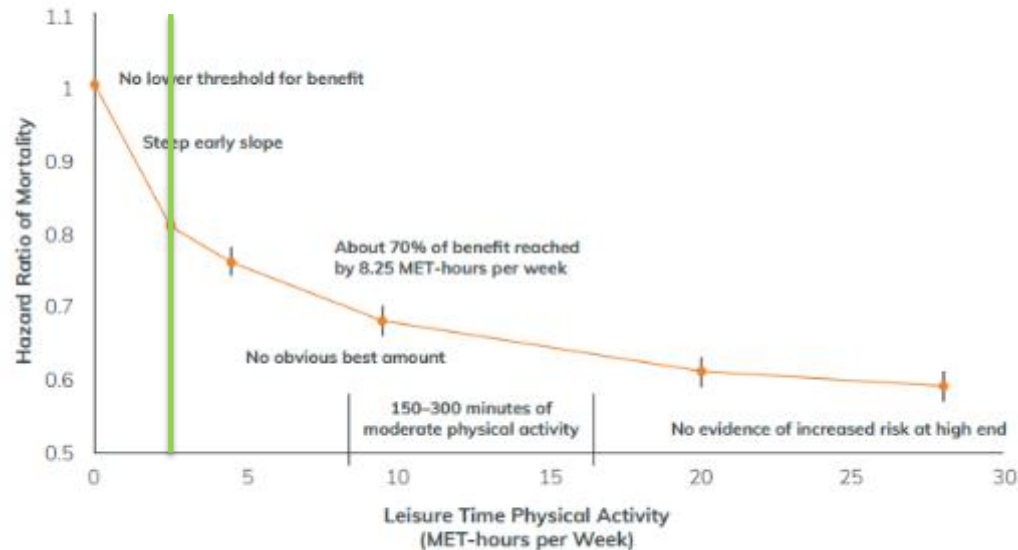

**3-4** days per week

# Most important lesson of physical activity

Anything leisure time activity is better than nothing.

Figure 2-1. Relationship of Moderate-to-Vigorous Physical Activity to All-Cause Mortality

Source: Adapted from data found in Moore SC, Patel AV, Matthews CE. Leisure time physical activity of moderate to vigorous intensity and mortality: a large pooled cohort analysis. PLoS Med. 2012;9(11):e1001335. doi:10.1371/journal.pmed.1001335.

# Alcohol → -4 mmHg

Moderation...

One Standard Drink is:

12 oz. Beer  
(5% alcohol)

5 oz. Wine  
(10-12% alcohol)

3 oz. Fortified  
Wine  
(16-18% alcohol)

1.5 oz. Liquor  
(40% alcohol)

(1.5 oz. overproof  
liquor is  
about two  
standard drinks)

# When to consider medications?

## Risk Stratification + Blood pressure staging

- Stage 1 ( $\geq 130/\geq 80$ ) hypertension AND 10-year ASCVD risk of  $<10\%$ , IF BP still elevated between 3-6 months after non-pharmacologic (i.e., lifestyle) therapy initiation
- Stage 1 ( $\geq 130/\geq 80$ ) hypertension and 10-year ASCVD risk of  $\geq 10\%$
- Stage 2 ( $\geq 140/\geq 90$ ) hypertension, consider 2 agents of different classes
- Very high BP ( $\geq 180/\geq 110$ ) evaluate and prompt antihypertensive treatment

# Pharmacologic approaches

Monotherapy, low(er)-dose combination, or max-out then add-on

Rationale for **low(er) fixed dose combination** therapies over monotherapy for initial therapy:

- Combination of 2 agents at low doses gives greater blood pressure reductions than higher dose of 1 drug
- Fewer adverse effects (than high dose monotherapy)
- Blockade of several pathways that increase blood pressure
- Increased protection of target organs
- Prompt blood pressure control
- Effects independent of their antihypertensive actions
- Improved adherence in combination vs single add-ons

# Pharmacologic approaches

## Night-time or morning/daytime

There is a diurnal pattern of higher blood pressure in the morning and a decline in the late evening well described on 24-48 hour Ambulatory BP Monitoring (ABPM). There are those who do not experience dipping – so-called “non-dippers”. This is associated with stroke, MI, and cardiovascular death.

- Several studies have shown reduced new-onset DM, improved 24-hour blood pressure, and more importantly, reduction in cardiovascular events with **night-time dosing** versus morning/daytime.

# Medication class for hypertension is like putting out a fire

Not enough, not the right liquid, think of fire mechanism

# Pharmacotherapeutics

Initiation, what to start with? First line and/or condition driven

Regardless of underlying conditions, **start with agents that have data for clinical outcomes benefits**, i.e., have clinical trial data demonstrating reduction of CVD events, CKD progression, etc.

Primary agents used in the treatment of hypertension include:

- **thiazide diuretics** – (e.g., chlorthalidone, hydrochlorothiazide, indapamide, etc.)
- **ACE inhibitors** – (e.g., enalapril, lisinopril, benazepril, etc.)
- **ARBs** – (e.g., candesartan, irbesartan, losartan, etc.)
- **CCBs dihydropyridine** – (e.g., amlodipine, felodipine, nicardipine, etc.)
- **CCBs nondihydropyridine** – (e.g., diltiazem and verapamil)

# Case 1

45-year-old female presents to establish care. She reports feeling well.

PMHx: Hypothyroidism. OB/GYN: No pre-eclampsia. Last menses 3 weeks ago.

FMHx: Mother had MI at age 65, 2 stents. Father is A&W.

SocHx: Bank manager. Married with 2 children. **Current smoker** and drinks 1-3 glasses of wine a week with dinner. Does not follow any specific physical activity regimen.

MEDS: levothyroxine 88 mcg qd, MVI

Vitals: BP **135/85**, HR 80, SaO2 96%, T 98.9, Wt 165 Ht 5'5" BMI 27.5

LABS: **TC 220**, Trig 200, **HDL 50**, LDL 145. A1c 5.6%, Fasting Glucose 99 mg/dL

What is her ASCVD risk score? Do you agree? What are your recommendations?

The screenshot shows a medical history form with the following fields and values:

- Current Age:** 45 (with a note: "Age must be between 20-79")
- Sex:** Male
- Race:** White
- Systolic Blood Pressure (mm Hg):** (empty field, with a note: "Value must be between 90-200")
- Diastolic Blood Pressure (mm Hg):** (empty field, with a note: "Value must be between 60-130")
- Total Cholesterol (mg/dL):** (empty field, with a note: "Value must be between 140-500")
- HDL Cholesterol (mg/dL):** (empty field, with a note: "Value must be between 20-160")
- LDL Cholesterol (mg/dL):** (empty field, with a note: "Value must be between 90-340")
- History of Diabetes:** Yes (selected), No
- Smoker:** Current (selected), Former, Never
- On Hypertension Treatment:** Yes, No
- On a Statin:** Yes, No
- On Aspirin Therapy:** Yes, No

## Stage 1 - $\geq 130/\geq 80$ , ASCVD $<10\%$

1. Lifestyle modifications for health, e.g., smoking cessation, etc.
2. Teach self measurement and keep a home BP journal
3. Reassess progress at 3-6 months

|   |         |    |       |                                       |      |   |                         |     |  |
|---|---------|----|-------|---------------------------------------|------|---|-------------------------|-----|--|
| HIGH BLOOD PRESSURE<br>(HYPERTENSION) STAGE 1 | 130-139 | Or | 80-89 | Nonpharmacological therapy<br>Class I | <10% | - | 3-6 months<br>(Class I) | Yes | Reassess in 3-6 months<br>(Class I)  |
|   |         |    |       |                                       |      |   |                         | No  | Assess and optimize adherence to therapy and consider intensification of therapy |

# Case 2

63-year-old female presents for annual follow-up. She reports feeling well.

PMHx: Occasional headaches OB/GYN: Post-menopausal since early 50's.

FMHx: Sister suffered MI at age 65, 3vCABG. Parents have passed. 2 brothers, 1 with DMII.

Sochx: Medical Technologist, working part-time. Married with 2 adult children. **Current smoker**, no EtOH. Does not follow any specific physical activity regimen.

MEDS: Ibuprofen 400 mg PRN for headaches, MVI.

Vitals: BP **135/85**, HR 80, SaO2 96%, T 98.9, Wt 155 Ht 5'5" BMI 25.8

LABS: **TC 220**, Trig 200, **HDL 50**, LDL 145. A1c 5.6%, Fasting Glucose 99 mg/dL

What is her ASCVD risk score? Do you agree? What are your recommendations?

10.6% Current 10-Year ASCVD Risk  
Optimal ASCVD Risk: 3.2%

Current Age: 63  
Sex: Female  
Race: White

Systolic Blood Pressure (mmHg): 135  
Diastolic Blood Pressure (mmHg): 85

Total Cholesterol (mg/dL): 220  
HDL Cholesterol (mg/dL): 50  
LDL Cholesterol (mg/dL): 145

History of Diabetes: No  
Stroke: Current

On Hypertension Treatment: No  
On a Statin: No  
On Aspirin Therapy: No

## Stage 1 - $\geq 130/\geq 80$ , ASCVD $\geq 10\%$

1. Lifestyle modifications for health
2. BP lowering medication – absent risk factors, **chlorthalidone 25 mg** is reasonable.
3. Teach self measurement and keep a home BP journal
4. Reassess at 1 month

HIGH BLOOD PRESSURE  
(HYPERTENSION) STAGE 1

130-139

Or

80-89

Nonpharmacological therapy  
Class I

≥10%

Initiate BP meds  
(Class I).

Single or low-dose  
combination

1 month  
(Class I)

Yes

Reassess in 3-6 months  
(Class I)

No

Assess and optimize adherence to therapy and consider  
intensification of therapy

# Case 3

35-year-old male presents to establish care. He reports feeling well.

PMHx: Has not seen a provider since he was a child.

FMHx: He doesn't contact his family often.

Sochx: Receptionist at dental office. Single, no children or significant other. Nonsmoker, no EtOH. Exercises 1-2 times a week, lifting at the gym.

MEDS: Occasional "pre-workout protein powder"

Vitals: BP 150/75, HR 60, SaO2 97%, T 98.9, Wt 170 Ht 5'8" BMI 25.8

LABS: TC 200, Trig 135, HDL 40, LDL 120. A1c 5.5%, Fasting Glucose 70 mg/dL

What are your recommendations?

## Stage 2 - $\geq 140/\geq 90$

1. Lifestyle modifications for health
2. BP lowering medication, consider two agents – absent risk factors, **chlorthalidone 12 (or 25) mg and lisinopril 5 (or 10-20) mg** is reasonable.
3. Teach self measurement and keep a home BP journal
4. Reassess at 1 month

|  |      |    |     |                                    |                      |   |                   |     |  |
|--|------|----|-----|------------------------------------|----------------------|---|-------------------|-----|--|
| HIGH BLOOD PRESSURE (HYPERTENSION) STAGE 2 | ≥140 | Or | ≥90 | Nonpharmacological therapy Class I | No need to calculate | Initiate BP meds (Class I)  | 1 month (Class I) | Yes | Reassess in 3-6 months (Class I)   |
|  |      |    |     |                                    |                      | Consider initiation of two agents (1 each from a different class) |                   | No  | Assess and optimize adherence to therapy and consider intensification of therapy |

# Resistance

When blood pressure refuses to be controlled

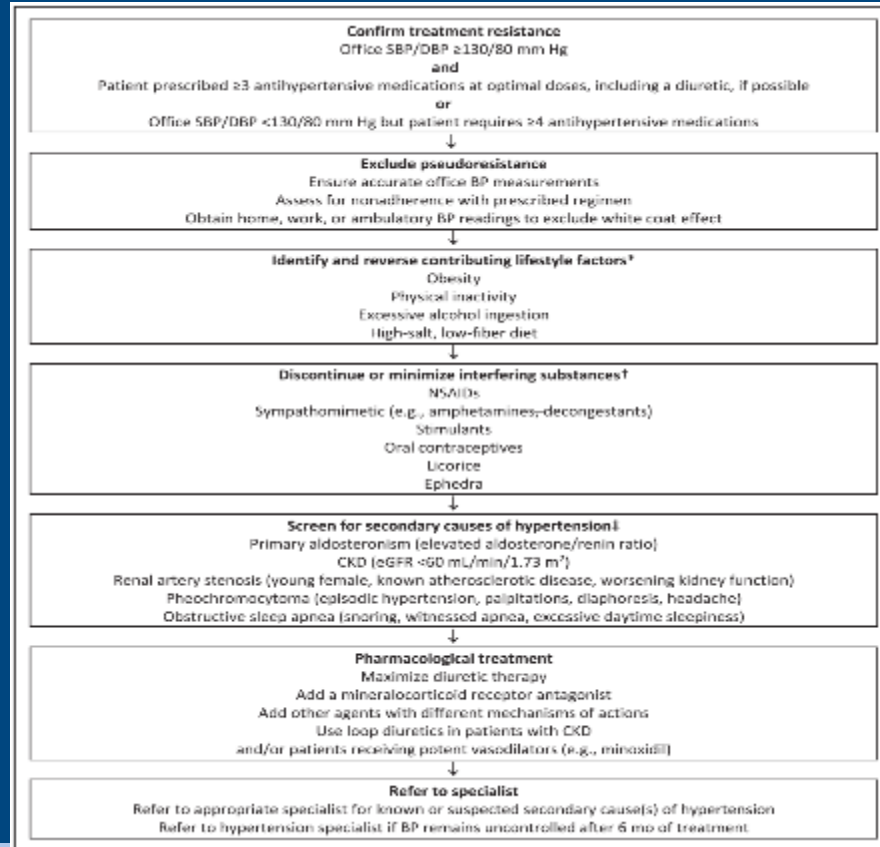

# Resistance? Recheck secondary causes

On average, it takes 2 and ½ BP medications to control BP

After 3 medications (one from three different classes, e.g., thiazide, ACEi/ARB, and CCB), if BP is still above goal:

- Reassess for modifiable secondary causes.
- Treat/Refer for treatment of secondary cause.

# Specific diseases and populations

BP goals (<130/<80) are the same. Individuals and disease are not.

Stable Ischemic Heart Disease – GDMT Bblockers, ACEi/ARB.

- Angina Pectoris, present = DHP CCB, not present = DHP CCBs, thiazides, MRA

HFrEF – GDMT Bblockers, ACEi/ARB/ARNI, MRA. NDHP CCB NOT recommended.

CKD – albuminuria ( $\geq 300$  mg/day or  $\geq 300$  mg/g creatinine by first morning void) is present, ACEi, ARB if ACEi not tolerated.

DM – All first line medications (e.g., thiazides, ACEi/ARB, DHP/NDHP CCBs) are reasonable.

# Specific diseases and populations

BP goals (<130/<80) are the same. Individuals and disease are not.

African American, Black – Thiazides and DHP/NDHP CCB are recommended first line.

Pregnant Women – methyldopa, nifedipine, and/or labetalol.

Age >65 – **if** high burden of comorbidity and limited life expectancy, **then** clinical judgment, patient preference, and a team-based approach to assess risk/ benefit is reasonable for decisions regarding intensity of BP lowering and choice of antihypertensive drug

# Summary

1. Utilize the latest guidelines, 2017 AHA/ACC
2. Blood Pressures  $\geq 130/ \geq 80$  = HYPERTENSION
3. Goal in almost all people, across disease and populations =  $< 130/ < 80$
4. PROMOTE OPTIMAL LIFESTYLE, ALWAYS
5. 1<sup>st</sup> Line BP classes also have evidence for outcome benefit – Thiazides (specifically chlorthalidone), ACEi/ARB, CCBs.
6. Individualize therapy to population and disease, consider low(er)-combination doses before maximal single, educate and engage patients.
